Splenomegaly	5/14/2012	
Exam Date	Report Date	
5/14/2012	5/14/2012	

**Accession:** 472588

**Examination:** ABDOMINAL ULTRASOUND

**Clinical History:** Splenomegaly.

**Comparison:** None.

**Findings:**

The liver is mildly enlarged with heterogeneous echotexture, but no focal mass. Abdominal aorta demonstrates no aneurysm with maximum dimension proximal 2.1 cms, mid 2.1 cms and distal 1.9 cms. Gallbladder reveals no gallbladder wall thickening, pericholecystic fluid or cholelithiasis.

Pancreas has normal echotexture and size. Common hepatic duct normal at 5 mm.

Right kidney measures 12.1 cms x 5.8 cms and 6.0 cms and the left kidney 9.4 cms x 5.5 cms x 4.3 cms. No solid renal mass, hydronephrosis or renal calculus. There is a 2.6 cms cyst at the lower pole of the right kidney.

Spleen is markedly enlarged measuring up to 20.3 cms with multiple heterogeneous hypoechoic area scattered about the spleen.

**Impression:**

1. Marked splenomegaly with multiple heterogeneous hypoechoic areas/lesions involving the spleen. Neoplastic process cannot be excluded. Recommendation is for follow-up CT study of abdomen to evaluate further.

2. Mild hepatomegaly with mild diffuse fatty infiltration of liver.

3. A 2.6 cms cyst at lower pole of right kidney.

4. Otherwise, no other significant sonographic findings involving the abdomen as described above.
